\lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n} \\ \lambda_{n} + \lambda_{n} \end{pmatrix} \begin{pmatrix} \lambda_{n} + \lambda_{n}$$

$$\Rightarrow \frac{16WT}{7\Delta^{2}} \cdot \frac{WTn}{L} > (\lambda nTL)^{2}$$

$$=) \qquad (\lambda n \overline{l}) \leq \sqrt{\frac{8}{2}} \frac{1}{\Delta} W \cdot \overline{J} n$$

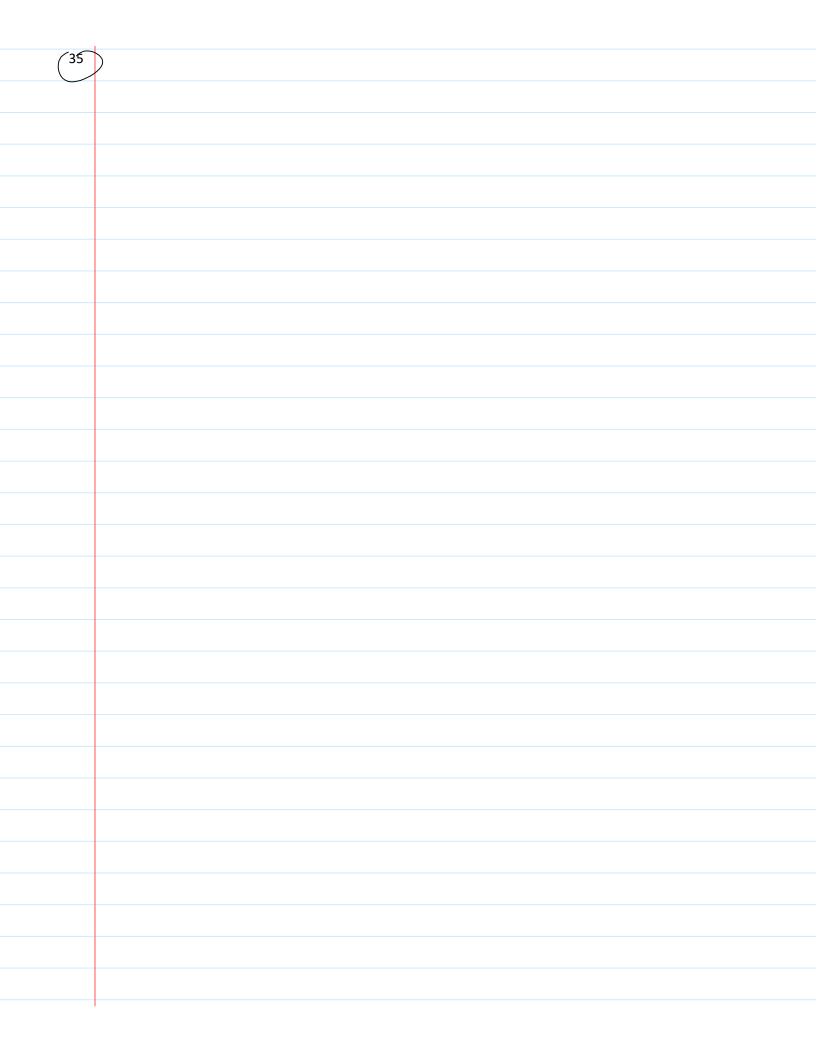

$$(bits-meters/sec)$$

Note that this is a deterministic Jound regardless of the placements of the source - destination pairs.

For the case when the source & destination nodes are placed uniformly inside a unit area.

$$\overline{L} = O(1)$$

$$\Rightarrow \sum_{k=1}^{\infty} O\left(\sqrt{\frac{8}{7}} - \sqrt{\frac{W}{5}}\right)$$

Upper bound - handout

Tuesday, February 05, 2008

3:40 PM

Three constraints

D (distance)

$$\frac{\lambda nT}{2} \stackrel{h(b)}{=} r_b^h \ge \lambda nT \overline{L}$$

$$b = 1 \quad h = 1$$

(2) (5 and midsh)

$$\lambda nT$$
 $b=1$
 $h(b) \leq \frac{WTn}{2}$

(1) (Interference)

$$\frac{\lambda nT}{2} \frac{h(b)}{2} \frac{z s^{2}}{16} (r_{b})^{2} \leq W \cdot T$$

They are sufficient for deriving an upper sound on In I

By (andy - Schwartz Inequality

(\(\frac{z}{n} a_n^2\)) \(\(\frac{z}{n} b_n^2\) \(\frac{z}{n} a_n b_n\)

$$\left(\begin{array}{cccc} \lambda_{nT} & h(b) \\ \hline \end{array}\right)$$

$$\Rightarrow \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda_{n} + h(b) \end{pmatrix} \begin{pmatrix} \lambda_{n} + h(b) \\ \lambda$$

 \Rightarrow

$$=) \qquad (\lambda n I) \leq \sqrt{\frac{8}{2}} \frac{1}{\Delta} W \cdot \sqrt{J} n$$

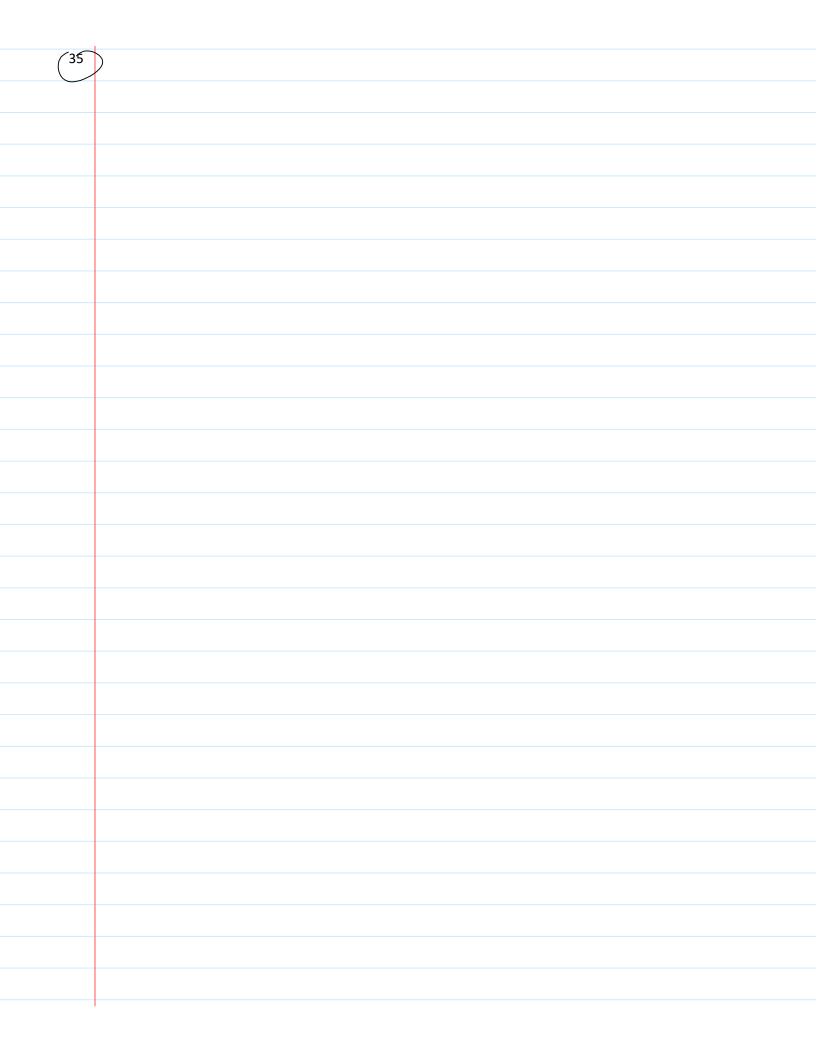

$$(b : ts - meters/sec)$$

Note that this is a deterministic Jound regardless of the placements of the source - destination pairs.

For the case when the source & destination nodes are placed uniformly inside a unit area.

$$\overline{L} = O(1)$$

$$\Rightarrow \sum_{i=1}^{n} \sum_{i=1}^{n} \frac{1}{2} \frac{W}{\sqrt{2n}}$$

Tracing back the proof - 15min

Sunday, February 10, 2008 3:29 PN

Tracing back the proof, we can find the optimal value of ro, h(b), lete in order to attain this bound closely.

In order to reach $\lambda = \Theta\left(\frac{1}{\ln n}\right)$

Equality in (4) holds if and only it

 $\frac{\lambda nT}{b=1} h(b) = \frac{w7n}{2}$

 $\Rightarrow r = \frac{2\lambda \bar{c}}{W}$

Since we want Int = J& WIn

 $=) r = \sqrt{\frac{31}{2}} \frac{1}{2} \frac{1}{n} = \Theta(\frac{1}{2n})$

 $h(b) = \frac{L}{r} = \Theta(T_n)$

Roughly speaking

- Each hop is of distance \$\text{D}(\frac{1}{Tm})\$

- Need (A) (In) hops to reach the destination.

Problem:

There may not be a reighbor within $\bigoplus \left(\frac{1}{m}\right)$ distance.

- The # of wells in an area A
follows a binomial distribution
with (n-1, A)
- expected # of nodes = (n-1). A

- The area of the neighbourhood should be at least to, so that in expectation there is at least 1 reighbor.

Still, this is not enough because the prob. of harring no neighbor is

 $(1-A)^{n-1} \approx \left(1-\frac{1}{n}\right)^{n-1} \approx \frac{1}{e}$

- At there are n modes, with high chance one of the nodes will have no neighbors in $\frac{1}{\sqrt{n}}$ radius.

- In fact, even increasing A to
$$A = \frac{b}{n} \text{ will not solve the}$$

$$problem.$$

$$(1-A)^{n-1} \approx \left(1-\frac{b}{n}\right)^{n-1} = \frac{1}{e^b}$$

Suntin:

$$\left(1-\frac{b \cdot lyn}{n}\right)^{N-1}$$

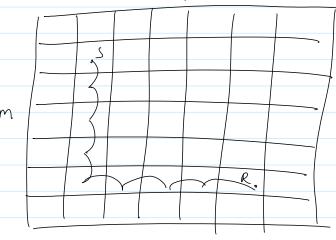

Prob. of any one node having no neighbors in (13h) radius n-(1- blyn n-1 S The $W:+h \quad b \geq 2$, this prob. $\rightarrow 0 \quad cos \quad n \rightarrow t \otimes$ of course the capacity will not be optimal. new logn factor attains) = A (h lyn) 50 - will succeed with high probability, i.e. probability $\rightarrow 1$ as $n \rightarrow +\infty$

Lower (attainable) bound -10min

Tuesday, February 05, 2008 3:50 PM

Proof: (Purely centralized scheme)

Divide the unit square into a grid of mxm cells, each cell of area m2

We only use transmission across heighboring cells, and parkets are routed day one direction first, then along another direction.

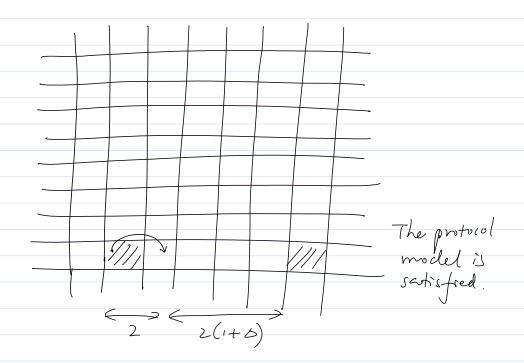

For this to work:

- O each cell must have at least one invole
- D no cells can be overly congested for relay traffic.

 (3) the schedules must satisfy the

 protocol model

Claim: Fach cell can be activated at least once every (4+20)2
time-slots

Hence, assuming that all cells can be activated simultaneously only lead to a constant factor of difference.

i.e.,
$$m = \sqrt{\frac{n}{2 \log n}}$$

(When n is large, the rounding factor can be ignored).

Claim: all cells have at least one node with prob > 0 as n > + vo

Sketch: given a cell, the prob. that it is empty is

$$\left(1-\frac{2lgn}{n}\right)^{\frac{1}{n}}$$
 $\frac{1}{n}$ $\frac{1}{n^{2}}$

Any cell is empty with prob. $m^2 \cdot \frac{1}{n^2} \rightarrow 0$ as $n \rightarrow + v$ Hence, all cells can forward traffic with high probability.

Attainable bound - handout

Tuesday, February 05, 2008 3:50 PM

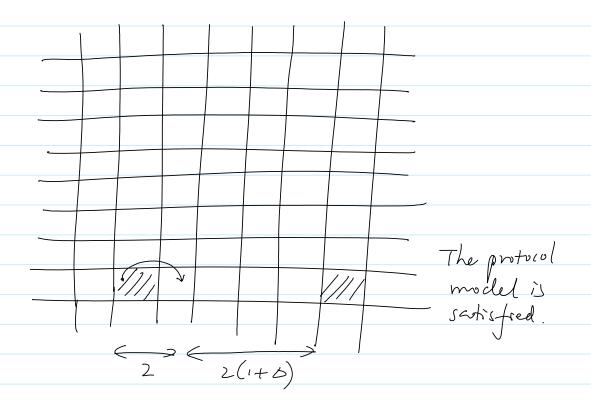

Divide the unit square into a grid of mxm cells, each cell of area mi

m R.

We only use transmission across heighboring cells, and parkets are routed day one direction first, then along another direction.

For this to work:

- (1)
- (3)
- 2) Claim: Fach cell can be activated at least once every (4+20)2 time-shots

Hence, assuming that all cells can be activated simultaneoutly only lead to a constant factor of difference.

D Now, let the cell size be $\frac{2 \log n}{n} | \frac{1}{2} \times | \frac{2 \log n}{n} | \frac{1}{n}$ i.e., $m = \sqrt{\frac{n}{2 \log n}}$ (When n is large, the rounding factor can be ignored).

Claim: all cells have at least one node with $pnob \rightarrow 0$ as $n \rightarrow t > 0$

Sketch: given a cell, the prob. that it is empty is $\left(1-\frac{2lgn}{n}\right)^n \approx e^{-2lgn} = \frac{1}{n^2}$ Any cell is empty with prob. $m^2 \cdot \frac{1}{n^2} \rightarrow 0$ as $n \rightarrow + \infty$ Hence, all cells can forward traffic with high probability. On average, each cell have $\frac{\eta}{m} = \int_{2h} lg n$ connections passing through it in each direction. Sketch: Fix a particular cell.

The prob. that a connection guess

through the cell

=

m Let X be the # of connections going through the cell. $E[X] = \frac{n}{m} = J_2 n l g n$ However, some cell may have to support more that E(X) connections Claim: With high probability, all cell has at most $\frac{2N}{m} = [8nlyn]$

lec23-mwf-new Page 17

cell has at most $\frac{2^{n}}{m} = |g_{n}|g_{n}$ connections passing through it in both directions.

We have shown:

- each cell is of size $O(\sqrt[2lgn]) \times O(\sqrt[2lgn])$ - each cell can be activated once every $(2+2s)^{-1}$ slots

- with high prob, all cells have at least one made

Next, vonte packets first along the M-axis.

On average, each cell have $\frac{\eta}{m} = J_2hlgh$ connections passing through it in each direction.

Sketch: Fix a particular cell.

The prob. that a connection gues

through the cell

=

m

Let X be the # of connections gring through the cell.

 $E[X] = \frac{n}{m} = J2nlyn$

Hovever, some cell may have to support more that E(X) annections Claim: With high probability, all cell has at most $\frac{2n}{m} = \int 8n lyn$ connections passing through it in both directions.

We next show that $P\{X \ge 2\frac{\eta}{m}\}$ will be very small.

In particular, note that
$$E[e^{SX}] = \left(E[e^{S.1}] + Connection \\ Sues through the J]\right)^n$$

$$= \left(1 - \frac{1}{m} + e^{S} - \frac{1}{m}\right)^n$$

$$\leq e \times p\left(\frac{n}{m}(e^{S-1})\right)$$

Hence, the prob. that $X \ge 2\frac{n}{m}$ is $Pr(X \ge \frac{2n}{m}) \le \frac{E[e^{SX}]}{e^{S \cdot \frac{2n}{m}}}$

$$\leq exp\left(\frac{n}{m}\left(e^{s-1-2s}\right)\right)$$

$$\Rightarrow$$
 $e^{5}-1-25=1-2\log 2=-0.386 \le -\frac{1}{4}$

Since
$$\frac{n}{m} = J_{2n} \log n \ge \log n$$
 for layer

$$\Rightarrow P(X) = \frac{2n}{m} \leq \exp(-2lgn) = \frac{1}{n^2}$$

=) P{any cell has more than
$$\frac{2n}{m}$$

connections along the y-axis}
 $(\frac{1}{n^2} - m^2) \rightarrow 0$ as $n \rightarrow t p$

Rest of proof (lower bound) - 5min

Sunday, February 10, 2008 4:06 PM

Since each cell allows W bits/sec passing through it, hence the lend-to-end capacity for each connection is at least

 $\frac{1}{(4+2\delta)^2} \cdot \frac{W}{2 \cdot \frac{2n}{m}} = \frac{W}{(4+2\delta)^2 \cdot 4 \cdot Jznlgn}$
